Field of the Invention The present invention relates generally to a cutting-off device used for sewing machines, and more particularly to a mounting structure for a pressure lever provided in a case. 2. Description of the Related Art One known conventional cutting-off device for a sewing machine is disclosed in Japanese Utility Model Laid-Open Publication No. 4-6191. In this cutting-off device, the pressure lever is mounted to an upper surface of a case on which the pressure lever is formed, and the pressure lever includes a pressure plate which is mounted on the case, and a pinion meshed with a rotary shaft which is provided on a rotary shaft pinion shaft of a sewing machine. The pinion is rotatably mounted on the pressure plate. Thus, the pressure plate is moved toward and away from the case by rotation of the pinion. Thus, the pressure plate presses a needle bar downward by the force of the pressure plate. Thus, the needle bar is pressed against a needle, whereby sewing thread on a thread supply bobbin is cut off. In this conventional cutting-off device, however, the pressure plate moves in a direction perpendicular to a plane in which the case extends. Thus, the weight of the pressure plate tends to be exerted in a direction perpendicular to the plane in which the case extends. Therefore, the pressure plate tends to be deformed due to the weight of the pressure plate. Another known conventional cutting-off device for a sewing machine is disclosed in Japanese Utility Model Laid-Open Publication No. 4-82392.
