" } Q: How to write a predicate that ensures both columns match? I have a table with two columns: company and contact. I want a predicate that ensures that company and contact columns are exactly the same. I have the following sql select \* from tbl\_cust\_contact where cust\_company='ACME' and contact = 'Cust12' I want to ensure that 'ACME' appears in the company column, and 'Cust12' appears in the contact column. A: You can also use: select \* from tbl\_cust\_contact where cust\_company='ACME' and contact = 'Cust12' and company = contact A: Your example is not quite clear, but I think you are looking for select \* from tbl\_cust\_contact where cust\_company='ACME' and contact = 'Cust12' Q: How to set up an access to a mongodb database that only allow insert operation I would like to allow only insertion operations from a program that have its access to my database. Do you have an idea? Thanks A: As the name says you can set up a database where only inserts are allowed. To accomplish this you can use a Replica Set. A replica set is made of a primary database and up to three other secondary databases. To set up a replica set you need an additional server

---

called a config server. All the new servers will connect to this server and the config server will answer to them for the different database operations (inserts, updates, deletes). The remaining servers will communicate with each other to replicate the data from the primary database. The primary will be the one where the applications are running and will manage all the operations. You can read more about it here : It is a very good practice to have a replica set in production. Replica sets are very fast and they will scale very well as you will need to add more servers when your traffic goes up. You can find more information about setting up a replica set here: p2d92ce491b
