is not signed on the XML document. The activation server cannot extract the digital signature from the document. Autocad We contacted Microsoft regarding this problem and they told us it is a problem with the activation server not able to verify the signature. They asked us to send them an example of the xml document to see if it is signed. They were also able to reproduce the problem by running Autocad on their servers. They asked us to file a bug with the XML code and give them a free serial number, we have. After a little more than a month of testing and checking of code and serial number, they have been able to reproduce the problem. They are sending us the current signature verification servers and are planning to release the new Microsoft update that contains a fix to this problem. So we hope that in a week we will be able to have a verified product code for 2005.

Description A longstanding problem has been identified and is now being addressed by a long term project by the Portuguese Research Foundation (FCT) and CNED, supported by the EU-CATCH project. Stressors associated with land use and land cover change can induce a variety of severe impacts on marine ecosystems, thus, contributing to an increase in marine bio- and pollutant accumulation. The project will develop methodology to assist decision makers in planning and implementing integrated land and marine policies and programmes (i.e. Bio-Acidification Prevention and Adaptation and Coastal Management and Environment). In particular, the project will provide a detailed understanding of the impacts of land use and land cover change on biological and chemical processes in the ocean and on coastal areas. This knowledge will help to identify the mechanisms and processes responsible for the impacts of land use and land cover change, and to provide relevant assessment approaches. Knowledge gained will be used to address the specific needs of the EU-CATCH project and contribute to the design and implementation of a national bio- and environmental management plan, in Portugal. The project will work with 14 partner organisations from 9 European and 12 African countries, and will carry out laboratory experiments and site observations, using samples from more than 500 coastal sites. Data collected will be tested and validated for regional and global trends, for which a number of indicators will be defined. The developed indicators will serve as benchmarks for the assessment of the effects of land use and land cover change. The data will also be used for modelling purposes.

Q: C# - Removing decimal point from f3e1b3768c
