This study was designed to evaluate the bladder capacity and abdominal wall compliance in patients with chronic kidney disease. The study group included 53 patients (37 males, 16 females; mean age, 47.7 +/- 18.2 years)

with chronic kidney disease who were not undergoing dialysis. All of the patients had blood urea nitrogen and creatinine levels ranging from 16.2 to 171.4 mg/dl (mean, 56.5 +/- 35.5 mg/dl) and from 0.8 to 11.3 mg/dl (mean, 3.8 +/- 2.5 mg/dl), respectively. To assess bladder capacity, bladder ultrasound was performed using the bladder area method. To assess abdominal wall compliance, abdominal sonography was performed with a 1.5- to 5-MHz probe. To assess the abdominal muscle thickness, a computed tomography scan was performed with a 1.5- to 5-mm slice thickness. The mean bladder capacity was 267.3 +/- 122.8 ml and the mean abdominal wall compliance was 2.3 +/- 1.5 ml/mm Hg. However, there was no significant difference in bladder capacity and abdominal wall compliance among patients with creatinine levels less than 6.0 mg/dl, 6.0 to 10.0 mg/ 2d92ce491b
