For more information see: For more information see: Compartmentalization of the effects of adrenergic stimulation and inhibition in the pig heart: effects of propranolol on catecholamine-dependent effects in a single cardiac chamber. The aim was to examine whether the magnitude of the effects of the beta-blocker propranolol on cardiac functions can be dissociated from the drug effects in a single cardiac chamber. Pigs were anesthetized and each heart was isolated and perfused in the Langendorff mode. The effects of 1 microM isoproterenol and/or 10 microM propranolol on parameters of the heart rate (HR), blood flow (BF) and left ventricular contractility were determined in the right (RV) and left (LV) ventricles of anesthetized (n = 24) and awake pigs (n = 24). Isoproterenol (n = 9) increased HR and BF significantly more in the LV than in the RV (P
